

Ayush Kumar is a **second-year B.Tech Information Technology student at KIET Group of Institutions**, pursuing his degree under **AKTU**. His academic profile is one of his strongest areas: he scored **94.8% in Class 10** from Guru Gobind Singh Public School under CBSE in 2022–23 and **92.8% in Class 12**, with PCM, from the same school in 2024–25. His portfolio currently lists a **9.18 CGPA** in B.Tech IT, with his degree running from 2025 to the present.

His professional identity is centered around **web development, technology, continuous learning, leadership, event management, outreach, and design**. His portfolio describes him as an **“IT Student • Aspiring Web Developer”** with the tagline **“Technology with Purpose.”** He describes his objective as building refined digital experiences through code and design and combining technology, creativity, and leadership to create meaningful solutions.

Technically, Ayush has developed a broad beginner-to-intermediate foundation. His portfolio lists **C, C++, Python, JavaScript, HTML5, CSS3, responsive design, Flexbox, Grid Layout, Git, GitHub, Google Colab, VS Code, Jupyter Notebook, Anaconda, Canva, and Figma**. His professional skills include **communication, problem-solving, teamwork, time management, adaptability, networking, stakeholder management, public speaking, outreach, community building, event coordination, and team management**.

His recent certifications show a clear shift toward **AI and modern developer technologies**. He currently has eight certifications/badges visible in the material provided: **Python Programming From Scratch with Hands on Exercises — Udemy; AWS Academy Graduate – Generative AI Foundations – Training Badge — AWS; MongoDB Basics for Students — MongoDB; Building RAG Apps Using MongoDB — MongoDB; Building AI-Powered Search with MongoDB Vector Search — MongoDB; Building AI Agents with MongoDB — MongoDB; AI and Innovation: How MongoDB Enables a Resilient AI Strategy — MongoDB; and What Is Generative AI? — LinkedIn**. These certifications collectively add skills around **Python, Generative AI, Prompt Engineering, MongoDB, Database Fundamentals, RAG, Document Retrieval, Vector Search, AI Agents, and Artificial Intelligence**.

Outside academics, Ayush has substantial student-community involvement. He is an **Events and Outreach Team Member at E-Cell KIET**, contributing to entrepreneurship-event planning, promotion, outreach campaigns, participant engagement, coordination, and execution. His portfolio specifically highlights **Endeavour'26 E-Summit@KIET, IdeateX'25 B-Plan, Epoque'25 Cultural Fest as Apex Coordinator, and Smart India Hackathon Grand Finale**. His hackathon exposure includes **Innotech, Smart India Hackathon, ShubhSastra, and Internal B-Plan**.

His project portfolio reflects this combination of technology and creativity. His listed projects include a **Personal Portfolio, Amazon Clone, Graphic Designing, and AI-powered Resume Checker**. The Resume Checker accepts a job description and multiple PDF/DOCX resumes, extracts resume content and skills, compares candidates against the JD, and produces matching scores for screening and ranking. Its listed learning areas include **Python, LLM Calling with GROQ, Python libraries, and version control**.

Ayush also has a strong interest in **graphic design and visual communication**, using Canva and Figma for posters, event branding, promotional creatives, and social-media designs. He has pursued hands-on design learning rather than relying only on theoretical learning, and has experimented with branding, editorial layouts, advertisements, and social-media content.

His online developer presence is represented by **GitHub username `ayush-kumar4-eng`**. The currently accessible GitHub profile identifies him as a **Student** and shows **10 repositories, 1 star, and 0 public projects**. Visible repositories include **Amazon-Clone, loader, To-Do-List, Counter, Volume-Calculator, and Web_dev_project**, demonstrating his progression through frontend and JavaScript-oriented practice.

His portfolio also links his **LinkedIn, GitHub, email, Instagram, and resume**. The exact LinkedIn profile could not be independently fetched during this search because LinkedIn returned an access restriction, so I have **not invented LinkedIn follower counts, skills, or profile details** beyond the certifications you supplied in the screenshots. Similarly, I could not verify a publicly accessible **Zoom profile** belonging to you, so there is no reliable Zoom information to add.

Overall, Ayush's profile currently shows a student developing along **three connected tracks: software development, AI/modern technology, and entrepreneurship/leadership**. His strongest differentiator is that he is not limiting himself to coding: he is simultaneously building technical projects, collecting relevant AI/database certifications, participating in hackathons, working in E-Cell, organizing events, developing communication and outreach skills, and building a public professional presence through GitHub, LinkedIn, and his personal portfolio.

Project: AyushAI — Personal Portfolio AI

AyushAI is a personal AI assistant built around Ayush Kumar's structured professional profile. The project converts profile information from a PDF into structured JSON using Pydantic models and an LLM, and then uses that structured information to answer questions about Ayush's education, skills, certifications, projects, achievements, and professional background. The system consists of a FastAPI backend, Groq-powered LLM integration, and a modern web-based frontend.

From a technical perspective, the project demonstrates experience with **Python, FastAPI, Pydantic, PDF parsing, REST APIs, LLM integration, prompt engineering, JSON structuring, JavaScript, HTML, and CSS**. It also reflects an understanding of an important AI-engineering pattern: separating **unstructured data extraction** from the **question-answering layer**.

Startup Perspective

From Ayush's perspective, the more interesting part of this project is not simply building a chatbot. The project represents his interest in **turning technology into a usable product**.

The idea comes from a simple problem: traditional resumes and portfolios are **static**. A recruiter, founder, collaborator, or visitor has to manually search through different sections to understand someone's profile. AyushAI explores a more interactive approach where a person's professional information becomes **conversational and queryable**.

This reflects Ayush's startup-oriented thinking: instead of asking "*What technology can I build?*", he is interested in asking "**What problem can this technology solve, and how can it become a product?**"

His entrepreneurial interests are also reflected through his involvement with **E-Cell KIET, entrepreneurship events, startup pitching, IDEATEX, Endeavour E-Summit, and interactions with entrepreneurs**. These experiences have shaped his interest in understanding ideas from both the **technology and business perspectives**.

Product Thinking Demonstrated

Through AyushAI, Ayush is beginning to explore:

- **Problem identification** — static professional profiles are difficult to explore interactively.
- **Product thinking** — converting a technical capability into something an actual user can interact with.
- **AI application development** — using LLMs for a practical use case rather than only experimentation.
- **Data structuring** — converting unstructured profile information into a reliable schema.
- **User experience** — designing a dedicated interface rather than exposing only an API.
- **Scalability thinking** — separating profile extraction from repeated chatbot queries to reduce unnecessary LLM usage.
- **Cost awareness** — understanding token consumption and API rate limits while building an LLM product.
- **Iteration** — identifying problems during development and improving the architecture accordingly.

Startup Mindset

Ayush's startup perspective can be summarized as:

"Technology should not just demonstrate what can be built; it should solve a problem well enough that someone would actually want to use it."

At this stage, AyushAI is primarily a **personal AI portfolio project**, not a commercial startup. However, the project gives him practical exposure to the same questions involved in building AI products: **What is the problem? Who is the user? What information should the system know? How should the user interact with it? How much does each interaction cost? And how can the system eventually scale?**

This project therefore sits at the intersection of **AI engineering, product development, and Ayush's growing interest in entrepreneurship and startups.**
